**Amendments to the Specification:**

Please replace paragraph 2 [the paragraph beginning on page 16, line 23] with the following amended paragraph:

In operation, by selectively applying a voltage potential to a respective emitter line 406 and one or more gate wires 604, selected portions of the emitter line 406 will be caused to emit electrons toward and illuminate a respective portion of the phosphor line 1002 formed on the anode plate above. Furthermore, as is similarly done in conventional pixilated FEDs, in order to affect the brightness of the illuminated portion of the phosphor lines, a potential is also applied to a metalized anode material to accelerate the electron emission toward the phosphor lines 1002. FIG. 10 also illustrates the alignment of the phosphor lines 1002 over respective ones of the emitter lines 406.
